Re: ADA Accessibility Survey and Assessment – Moreland Hall

Dear Gabriel,

We are pleased to submit this report for Moreland Hall. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

Syroun Z. Sanossian, Principal

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on February 1, 2017. The exterior site elements were assessed originally as part of the pedestrian facilities assessment, in June to September 2011, and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access, to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

Moreland Hall is a historic structure and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No “perfect” building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire on the part of OSU to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways;

1. **Narrative Analysis:** The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified, but also provides a discussion that analyses the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

   **NOTE:** Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. **Barrier Data Records:** Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.

   In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.
A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve Moreland Hall. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing on one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks as paved surfaces improved for use by pedestrians, but walkways are not located along or adjacent to the curb line, gutter or roadway and walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.

As a public building that was constructed prior to the passage of the ADA, Moreland Hall should have at least one accessible entrance. The accessible entrance was identified as the south entrance. This entrance was provided with a ramp and a stairway that leads to the main entrance on the first floor and a central corridor where an elevator is used to transport passengers to reach all floors.
Moreland Hall has an accessible route provided within the site from accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public transportation stops to the accessible building or facility entrance they serve as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided within the ADA Assessment and Survey of the pedestrian facilities (provided as a separate report) as well as in the following records. Please see the barrier data records for details.

B. Building Entrances

The building is located at the corner of SW 26th street and SW Jefferson Avenue, within campus. On-site parking is provided on the southwest of the building and was identified with non-accessible slopes. An abrupt change in level was identified in the path to the entrance. A ramp, on the south side of the building, led to the first floor but the ramp lacked accessible handrails and running slope. Emergency exit stairways were located at several locations around the building. These stairways were in original condition and lacked accessible handrails and contrasting colors at stairway treads. ISA directional signage is recommended in locations at junctions in the accessible route to help ensure that pedestrians seeking an accessible entrance are not forced to retrace their steps.

INTERIOR SPACES

FIRST FLOOR

Moreland Hall is a three-story building that has classrooms, graduate student offices, and faculty offices. The main, and only, entry door had automatic door opening devices. These devices were functional, but lacked BHMA signs on each side of the doors meant as a safety precaution for able-bodied people to identify the doors as automatic. The main entry is directly connected to SW Jefferson Way and the campus pedestrian facility.

The lobby was not identified with an identification sign that indicates where accessible features are located. As a performance standard, it is recommended that lobby identification signage be provided on each floor in each central corridor that indicates the floor plan, the location of the person viewing the sign and the location of accessible features such as restrooms, elevator and drinking fountains in proximity to the location of the person reading the sign. Fire pulls were not accessible, and fire extinguishers and mechanical boxes created protruding objects in some locations within the circulation route. A drinking fountain was installed within the lobby area, but the fountain appeared to be original to the building and lacked knee clearance for those in a wheelchair and a bubbler height that short people could access. An interior ramp, that provided access to the east side of the building, was identified with a 1” lip at the bottom of the ramp transition from the corridor surface which could prevent access for people using wheelchairs or create a tripping situation for able-bodied people. The ramp also lacked a compliant slope and handrails.

A men’s restroom and two unisex restrooms were provided on the first floor, but the spaces appeared to be in original condition with entry vestibules leading to toilet rooms. The entry

1. 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points
doors were identified with non-accessible signage, heavy doors and non-accessible door hardware. Paper towel dispensers protruded into the circulation path with no detectable warning and the men’s restroom lacked an accessible lavatory and urinal. Toilet stalls were also in original condition and lacked adequate clear width or maneuvering clearance to allow a wheelchair user to enter past a privacy wall or enter into any of the multiple stalls. Additionally, a support rail was installed at 76” high above the toilet stall entry doors resulting in a protruding hazard. The two unisex restrooms had adequate space to be made compliant, but at present, lacked an accessible lavatory and toilet. The toilet was removed in toilet room 120A, during the time of the field investigation, due to scheduled maintenance.

Graduate offices on this floor carried many of the same barriers. Doors did not have accessible hardware, strike edge clearance, and necessary headroom. In many cases, light switches and outlets were not located within an accessible reach range. Clear floor space needed to enable use shelves and coat hook was blocked by furniture or stored items. Due to this, maneuvering clearances were also reduced.

An elevator provided vertical access to all floors. The elevator lacked accessible signage on doorjams, indicating the discharge level, and visual and audible signals were not provided in the elevator lobby on any floor. Other barriers to access included hall call buttons that were not fully illuminated for those with visual impairments, and emergency car control buttons that were not grouped together at the bottom of the control panel.

Stairways in the building appeared to have original handrails that lacked accessible extensions, grip height, and appeared to lack slip resistant surfaces. No contrasting color was identified at the stairway treads, which can be important to those with low vision. As a performance standard, it is highly recommended to provide contrasting color at stairway treads to improve visibility for all users.

Many staff use only areas were identified in the building. These spaces included IT rooms, janitorial rooms, private faculty offices and associated spaces. Signage at the door and doorway to these spaces were included in this report since they were located along the public circulation route of travel, but these interior spaces were not investigated as part of this assessment process. In general, institutions and organizations make staff use only areas accessible as needed through the reasonable accommodation iterative process between the employer and employee.

SECOND FLOOR

The second floor was identified with a waiting room, classroom, staff area, lounge, and a women’s restroom. A high-low drinking fountain was provided in the main lobby, although the fixture was not located within an alcove or otherwise protected for those with visual impairments traveling through the lobby area. The second floor provided many public spaces including central lobby, a lounge and a waiting room. Tables, desks and counters provided in these areas were not identified as accessible. In addition, entry doors were not located directly within the path of the stairway which created a protruding object within the path of travel.

Corridors on this floor were identified with non-accessible cross slopes. The central stairway was not enclosed and was identified as lacking a horn or strobe device, stair level identification signage and compliant handrails and guardrails. An emergency exit could be
made accessible to most people who use the building with the remediation of some barriers, although it will not be possible to connect the exit to an accessible route usable by people who use mobility assist devices. Other barriers on this floor were similar to those described on the first floor.

THIRD FLOOR

The third floor was identified with a classroom, staff area, lounge, graduate student office and men’s restroom. Corridors on this floor were identified with non-accessible cross slopes. The restroom on this floor was identified with no accessible fixtures similar to those described on other floors. The door landing and floor slope at the restroom, some classrooms and hallways, were also identified with a significant running slope. A high drinking fountain was installed within the hall area but no low fountain was provided for people who are short or who use wheelchairs. The women’s restroom provided on this floor was identified with barriers similar to those described in other restrooms, including a non-accessible entry door and fixtures.

The following barrier data records provide more detailed information on the barriers described above.

### Barriers Description

#### Barrier #38D

**Location:** Floor 2 - North Entrance V0201  
**Barrier Type:** Handrail - Intermediate >88" wide  
**Barrier Area:** Stairways  
**X Coordinate:** N/A  
**Y Coordinate:** N/A  
**Barrier #:** 38D  
**Notes:** Performance Standard  

#### Findings:

- 168" wide stairway more than 88" in width lacks at least 1 intermediate handrail for each 88" of width.

#### Recommended Solution:

- Provide one intermediate handrail per 88" stairway clear width.

#### Implementation Details:

- **Priority:** 2  
- **Status:** Open  
- **Cost Est:** $1,800.00  
- **Facility Function:** Public

**Barrier Type:** Contrasting Color - ADA  
**Barrier Area:** Stairways  
**X Coordinate:** N/A  
**Y Coordinate:** N/A  
**Barrier #:** 38E  
**Notes:**  

#### Findings:

- Treads lack contrasting color defined as 70% contrast.

#### Recommended Solution:

- Recommended: Consider providing contrasting color on each tread.

#### Implementation Details:

- **Priority:** 2  
- **Status:** Open  
- **Cost Est:** $280.00
