Re: ADA Accessibility Survey and Assessment – Wiegand Hall

Dear Gabriel,

We are pleased to submit this report for Wiegand Hall. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

Syroun Z. Sanossian, Principal

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on February 25, 2017. The exterior site elements were assessed originally as part of the pedestrian facilities assessment, in June to September 2011, and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access, to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

Wiegand Hall is a historic structure and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No “perfect” building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire on the part of OSU to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways;

1. **Narrative Analysis:** The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified, but also provides a discussion that analyses the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

   **NOTE:** Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. **Barrier Data Records:** Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.
In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.

A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve Wiegand Hall. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing on one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks as paved surfaces improved for use by pedestrians, but walkways are not located along or adjacent to the curb line, gutter or roadway and walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.

As a public building that was constructed prior to the passage of the ADA, Wiegand Hall
should have at least one accessible entrance. The accessible entrance is located in the center of the building on the east side. This entrance was provided with an accessible walkway that leads to the first floor main entrance and a corridor where an elevator is used to transport passengers to reach all floors.

Wiegand Hall has an accessible route provided within the site from accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public transportation stops to the accessible building or facility entrance they serve as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided within the ADA Assessment and Survey of the pedestrian facilities (provided as a separate report) as well as in the following records. Please see the barrier data records for details.

B. Building Entrances

The building is located along a major pedestrian way within campus northwest of SW Campus Way and SW 30th St. A parking lot is provided north and east of the building. Accessible parking is placed within close proximity that leads directly into the building but the current entry door near the parking stalls was inaccessible due to a curb. The building has multiple entrances with one accessible entrance located at east side of building. The east entrance was identified with automatic door openers leading into the first floor of the building. Stairways and raised curbs were identified at the north, west, and south entrances. Accessible handrails and contrasting color was not provided at the non-accessible entrances provided around the building. As a performance standard, it is highly recommended to provide contrasting color at stairway treads to improve visibility for all users.

INTERIOR SPACES

FIRST FLOOR

Wiegand Hall is a two-story building and is home to the department of Food Science and Technology. The main entrance to the building was located at the east side, on the first floor, where an automatic door opening device was provided. This device was functional but lacked accessible signage and did not remain open for at least 6 seconds. Also, the door landing was sloped on the interior side of the door, which was compensated by the addition of the automatic door opening device. As a performance standard, it is recommended that where a powered door is provided in a building or facility, a sign displaying the International Symbol of Accessibility (ISA) measuring at least 4” x 4” should accompany the automatic door actuating mechanism and that signage needs to provide a 70% contrast against the background wall surface (dark-on-light or light-on-dark).

1 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points
The vestibule and hall were identified with displays and visual information that is not accessible to the sight impaired. Controls and mechanisms such as fire pulls, fire extinguisher cabinets, panels and flyer holders were either not accessible or created protruding objects in some locations within the circulation route. A high drinking fountain that appeared to be original to the building was installed within the lobby, but there was no ISA directional signage indicating that a wheelchair accessible fountain was located on the same floor. The high fountain also protruded into the circulation path and should be located within an alcove or otherwise provided with detectable warnings. Light switches, outlets and other controls were also not at an accessible height, and visual signal appliances (strobes) were not provided in this building where a fire alarm system exists.

Barriers identified in the first floor were commonly identified throughout the building in common use areas. The classrooms, conference rooms, classroom/laboratory spaces, lounge, restroom, break room, and stairway on this floor lacked entry doors that operated with accessible opening force and door view panels were too high for people in wheelchairs or people that are short. In classrooms, entry doors were heavy and accessible signage was not provided in all locations. In many cases, controls such as light switches, electrical outlets, emergency phones and coat hooks were not accessible. Many public spaces such as break rooms, conference rooms, lounges, and workrooms on this floor and throughout the building have adequate square footage to enable access but the spaces have been filled with furniture and desks that together can hinder or prevent access. Instructional areas generally lacked accessible laboratory workspaces, work counters and sinks. In some cases, classrooms lacked accessible desks and maneuvering clearance. Existing furniture (desks, bookcases, file cabinets, etc.) could be rearranged but, in many cases, should be exchanged for smaller versions or removed to ensure access.

The elevator was functional, but lacked hall call and car control buttons that did not fully illuminate for those with visual impairments. The elevator also lacked audible and visual signals (hall lanterns) at the elevator lobby area and accessible emergency controls and call buttons within the elevator car. Other barriers to access identified at the elevator included a lack of accessible door jamb signs and the existing emergency controls were not accessible within a cabinet and were not usable for people who are deaf or speech impaired as they used voice communication to function.

Stairways were assessed and lacked accessible handrails and tactile signage including level identification signage for the visually impaired. The auditorium/classroom was identified with entrances at the upper level of seating, and lower level where the instruction takes place, but there was no accessible route within the auditorium that connected both levels. An accessible desk was provided on the lower level but the ratio of accessible desks needs to be increased in the space to provide an adequate number of accessible desks and those desks need to be dispersed to provide comparable lines of sight with other desks and seating areas.

An assisted listening system is provided in the room, and receivers can be obtained through OSU Disability Access Services. The podiums on the lower level and the desk where the instructor and students present information were not accessible. The prep sink
on the lower level was not accessible and the demonstration counter also lacked an accessible section. The stairways through the seating area lacked accessible handrails and contrasting color on stairway treads. Some stair steps were damaged and needed repair.

The men’s and women’s restroom on this floor were identified with automatic door opening devices although the fixtures in the restrooms were not consistently accessible. Signage identifying the restrooms as accessible was not provided at all restrooms. Paper towel dispensers and sanitary product dispensers protruded into the circulation path, and the drain located within the circulation path was damaged with a recessed edge and was located within the wheelchair maneuvering clearance at a lavatory. The men’s and women’s shower rooms were provided as part of the standard restrooms, but none of the shower rooms were accessible. Both shower rooms will need extensive remodeling to provide access.

Many staff use only areas were identified in the building. These spaces included IT rooms, janitorial rooms, private faculty offices and associated spaces. Signage at the door and doorway to these spaces were included in this report since they were located along the public circulation route of travel, but these interior spaces were not investigated as part of this assessment process. In general, institutions and organizations make staff use only areas accessible as needed through the reasonable accommodation iterative process between the employer and employee.

SECOND FLOOR

The faculty and graduate student offices, classrooms, conference room, restrooms, and workroom were identified with similar barriers detailed above. Conference rooms on this floor lacked accessible tables and assistive listening systems. The women’s multi-accommodation restroom was identified with non-accessible signage and door operating force and sweep. Fixtures and maneuvering clearance in the restroom were not identified as accessible.

The graduate student offices lacked accessible door hardware and maneuvering clearances, due to the locations of desks and trash bins. In some locations, the furniture was too large for the space available which reduced circulation paths making the rooms difficult for people using wheelchairs to enter or circulate in.

A behavioral science subject resting area was identified on this floor. The entry door to the corridor containing testing booth rooms lacked hardware, adequate clear width, and maneuvering clearance to make it possible for people using wheelchair to enter the space. The passageway within the corridor leading to each testing booth did not allow adequate clear width for someone in a wheelchair to turn and travel. Counters were not accessible and the computer monitors and shelves within the booths were not located within an accessible reach range.

The following barrier data records provide more detailed information on the barriers described above.

### Barrier Assessment

#### Barrier #1: Protruding Object - Wall-mounted

- **Location:** Floor 1 - Classroom 132
- **X Coordinate:** N/A
- **Y Coordinate:** N/A
- **Barrier Area:** Classrooms
- **Barrier Type:** Protruding Object - Wall-mounted
- **Code References:**
  - 2010 ADAS 307.2
- **Barrier Description:** Wall mounted object protrudes more than 4" from wall
- **Findings:** Keyboard protrudes 11" at 29" high
- **Rec. Solution:** Retract or provide detectable warning for the visually impaired
- **Barrier Severity:** 1 Necessary
- **Cost Est:** $550.00
- **Facility Function:** Public
- **Status:** Open
- **Implementation Priority:** 2
- **Implementation Phase:**
- **Implementation Date:**
- **Notes:** Barrier Severity: 1 Necessary

#### Barrier #2: Electrical Outlets - High Unobstructed
