Re: ADA Accessibility Survey and Assessment – Pharmacy Building

Dear Gabriel,

We are pleased to submit this report for the Pharmacy Building. This report is part of our project to provide a Campus Accessibility Survey and Assessment for Oregon State University. It is our hope that this report will assist OSU in improving access to people with disabilities to campus facilities.

SZS has been pleased to be a part of this effort to evaluate campus buildings using federal and state statutes and regulations, as well as universal design principles in order to create performance standards that will guide design, construction and maintenance on campus.

We look forward to discussing our findings with your team.

Regards,

Syroun Z. Sanossian, Principal

Syn Z. Som.

1. EXECUTIVE SUMMARY OF FINDINGS

The field investigation for the interior spaces began on October 30, 2015. The exterior site elements were assessed originally as part of the pedestrian facilities assessment in June-September 2011 and are included as an essential part of this report. Images of each physical element identified in this report were captured in HD digital photos, while manual measurements were taken to establish as-built conditions to facilitate the process of cost estimating. Digital photographs are provided within the report for each barrier to access, to facilitate the review of the data collected. We have found that technical data can be difficult to interpret without a visual component; the photos provide a clear connection between the technical data and each barrier to access.

The Pharmacy building is a historic structure and many barriers to access were identified in the building. That is quite typical, as barriers to access exist in virtually every building, whether new or existing.

No "perfect" building exists in the real world.

This ADA Assessment and Survey report is intended to not only identify barriers to access, but to provide solutions. The basis for this ADA Assessment and Survey process is the underlying desire, on the part of OSU, to improve access by relying on higher standards than the minimum requirements in state and federal building codes. SZS intends to provide the information in this report in a clear and easy to understand format. The information in this report is compiled for use by designated OSU staff and other interested persons, so the content is designed to be understood by professionals and laymen alike.

The findings presented are both narrative and technical in nature; barriers to access identified during the field investigation process are documented in two ways;

1. <u>Narrative Analysis:</u> The analysis of findings is contained in an executive summary in a narrative form that not only describes each type of barrier identified, but also provides a discussion that analyzes the functionality of physical elements. We also provide the reasoning and research behind the identification of barriers that conflict with universal design principles. This analysis may be accompanied by digital photographs or diagrams, where applicable.

NOTE: Understanding building function and usage is essential when interpreting the findings held in this report. The narrative is intended to facilitate this process.

2. <u>Barrier Data Records:</u> Individual barriers to access are entered into the SZS database so that technical information on the barriers can be provided as barrier data records. These barrier data records include digital photographs of each barrier identified, code references that determine the barrier to access, as-built measurements, barrier severity ratings, budgetary cost estimates, recommended solutions for barrier removal and a priority for barrier removal. The information is formatted with two barriers on each report page.

In order to consolidate the report data, some of the more typical barriers found in multiple locations have been grouped within the barrier data records with a description of the locations in which they were found.

A. Pedestrian Facilities and Exterior Spaces Analyzed

This report provides information on campus pedestrian facilities that serve the Pharmacy building. Many physical elements are part of the comprehensive whole that creates a pedestrian facility. The fundamental elements evaluated as to whether they provide accessible pedestrian facilities include the following:

- Sidewalks
- Walkways
- Ramps
- Curb Ramps
- Blended Transitions
- Signalized Intersections
- Stairways (94% of people with disabilities are not mobility impaired)
- Benches and other Seating Elements
- Picnic Facilities

The descriptions provided for physical elements in this report are intended to clearly describe the differences between each physical element, such as when a pedestrian route is a sidewalk, rather than a walkway. The descriptions are intended to explain how the elements interact to form a cohesive pedestrian facility. Other more specific information described within this section intends to provide guidance on determinations made in this report.

The key to providing accessible pedestrian facilities is in recognizing that different people with disabilities have different needs. Setting policies that speak to the entire group is essential, rather than focusing one particular subset of the overall group. Universal design principles govern here – physical elements should be usable to everyone that visits campus without having to resort to any adaptation or specialized design.

In summary, an accessible route exists within a building, property boundary or interior space and is separate from the PROW. Pedestrian walkways are similar to sidewalks, as paved surfaces are improved for use by pedestrians, but walkways are not located along or adjacent to the curb line, gutter or roadway. Also, walkways are generally not considered part of the PROW. The pedestrian facility is the combination of the PROW and the accessible route, which functions as a whole to provide pedestrian access to facility entrances.

As a public building that was constructed prior to the passage of the ADA, the Pharmacy building should have at least one accessible entrance, which was identified at the west entrance. This entrance is provided with an accessible ramp that leads to the first floor where a freight elevator is used to carry passengers to reach all floors.

The Pharmacy building has an accessible route provided within the site from accessible parking spaces and accessible passenger loading zones; public streets and sidewalks; and public transportation stops to the accessible building or facility entrance they serve¹ as compared to the 2010 ADA Standard for Accessible Design. Details on barriers identified in that route are provided within the ADA Assessment and Survey of the pedestrian facilities (as a separate report), as well as in the following records. Please see the barrier data records for details.

B. Building Entrances

The building is located near the corner of SW Jefferson Way and SW 15th Street within campus. The building is not connected to the existing sidewalk by an accessible route and accessible parking is not provided on-site. The accessible entrance to the building is located on the back side of the building and is not connected to an accessible route throughout campus. The accessible entrance can be reached by traveling 180 feet along a vehicular traffic lane, which is not provided with a detectable warning for the visually impaired.

The pedestrian route to the accessible entry door is sloped and the door to the building is equipped with an automatic door opening device, but the device actuator is not identified with an ISA symbol that has a 70% contrast with the background of the wall on which it is mounted and the actuator is not located on a level landing. It is recommended to move the actuator for the automatic door to a level location along the route to the door. As a performance standard, it is recommended that where a powered door is provided in a building or facility, a sign displaying the International Symbol of Accessibility (ISA) measuring at least 4" x 4" should accompany the automatic door actuating mechanism and that signage needs to provide a 70% contrast against the background wall surface (dark-on-light or light-on-dark).

_

¹ 2010 ADA Standards for Accessible Design, Section 206.2.1 Site Arrival Points

INTERIOR SPACES

BASEMENT

The Pharmacy building is a six-story building with a full basement. The Pharmacy building is accessed on the basement level through a corridor which leads to the public spaces and a freight elevator. The only elevator in building is designated as a freight elevator, and signage placed inside the elevator specifically states that it is not to be used as a passenger elevator. The elevator was identified with significant over/under-travel of more than 3". Controls and a sign inside the elevator indicate that a "jig button" should be used to correct the travel and bring the car level with floor landings but that control is located at 56" high and is not usable for the visually impaired. The elevator has car call buttons that are outside of accessible reach ranges and travel in the elevator is highly inconsistent, with a step at the threshold of several inches, in some locations. A leveling device is provided within the elevator to allow some self-leveling which is not considered accessible. The control button for self-leveling is not within accessible reach range and the mechanism is not simple to operate and causes the elevator car to move abruptly, which may cause people using mobility assist devices or others with balance challenges to fall. Additional functional issues identified at the elevator included a lack of a door delay when the doors meet an obstruction, no audible controls or lanterns, the call and car buttons were not within reach range and did not illuminate and no functional emergency call system was provided.

One men's restroom is provided on this floor. The door is not identified with tactile signage and a separate toilet room for wheelchair access is provided. The accessible toilet room also lacked identification signage on the wall or door. A coat rack was provided opposite from the accessible toilet room and no coat hooks were provided within accessible reach ranges. The accessible toilet room was identified with no door closer, which is a functional issue for people with disabilities. People using wheelchairs have an especially difficult challenge to open and close doors, which is why standard toilet stall compartment doors need have self-closing doors. An entry door to a single accommodation toilet room is no different. Other barriers to access include a lavatory that lacks accessible knee clearance, insulation and the distance between the wall and lavatory which is used for maneuvering clearance is not at least 60" wide. The rear grab bar is not centered and the side grab bar is installed so close to the toilet paper dispenser that the bar cannot be used. Access to the seat cover dispenser is blocked by the toilet and the toilet room is not provided with a visual signal appliance (strobe) device to warn the visually impaired. The larger toilet room was identified with a narrow entry door that could prevent access for people using wheelchairs, but it is the only location in this toilet facility that provides urinals, but those fixtures are not installed at an accessible height.

No low fountain was provided in the basement. The existing high fountain may not be usable for short people or for those who use mobility assist devices. Also, lobby informational signage is not provided, even though gender specific restrooms are provided on every other floor, and accessible drinking fountains are not provided on every floor.

A ramp provides access from one level of the corridor to the upper level. The ramp was identified with an excessive slope, no wheel guides at the bottom of the handrails and the surface of the ramp did not appear to be slip-resistant. Exit stairways located on the east and west sides of each floor were identified with heavy double doors at the stairway entries and no accessible handrails or guardrails, handrail extensions and grip height, as is common in historic structures with original handrails and guardrails. The ramp also caused a severe cross slope at the entrance door for one of the classrooms on the basement level. A sink where deionized water is available was also

located within the ramp and lacks a level landing, knee clearance and controls. The supply store is located on the basement level and neither of the two service counters were identified with accessible surface height. Visual signage was provided at each door on this level but tactile signage was lacking at each location, including exits and within stairways.

The stairways lacked level identification signage for the visually impaired, although visual signage for emergency personnel was provided where the exit stairways were enclosed. No contrasting color was identified at the stairway treads, which can be important to those with low vision and the stairway riser height was not consistent from step to step. This can cause difficulty for pedestrians with disabilities. As a performance standard, it is highly recommended to provide contrasting color at stairway treads to improve visibility for all users.

FIRST FLOOR

The main offices for academic departments are located on the first floor within the central corridor. The women's restroom on this floor is similar to the men's restroom on the basement floor. Laboratories and student PC laboratories on this floor lacked accessible entry door hardware. operating force where closers were installed, accessible signage, view panels usable by short people and the spaces lacked maneuvering clearance within the space to allow wheelchair users to participate in meetings. The clear floor space needed to enable use of whiteboards and chalkboards were blocked by furniture or stored items in some locations and the spaces generally lacked accessible light switches and outlets, accessible desks, computer workstations, coat racks and strobe devices. Where sinks were provided, access for wheelchair users and short people was not available. Light switches, and fire pulls throughout the building are located above accessible reach ranges and electrical panels or other elements protruded into the circulation path in corridors throughout the building. Common use areas, hallways and corridors lacked visual signal appliances (strobes), although horns connected to the fire alarm system were installed in corridors. Fire pulls used to actuate the fire alarm system were located above accessible reach ranges and the control mechanisms on the devices were also not usable for people with hand impairments.

Many staff use only areas were identified in the building. These spaces include IT rooms, janitorial rooms, private faculty offices and associated spaces. Signage at the door/doorway to these spaces were included in this report as it is located along the public circulation route of travel, but these interior spaces were not investigated as part of this assessment process. In general, institutions and organizations make staff-use-only areas accessible as needed through the reasonable accommodation iterative process between the employer and employee.

SECOND - SIXTH FLOORS

Floor 2 was identified with a laboratory with mock exam rooms. There were two rooms but neither room was designed with accessible counters, sinks, exam tables or maneuvering clearance. The upper floors were found to have the same barriers in the exit stairways and elevator as identified on other floors described above. A hi-low drinking fountain unit was identified on the third floor corridor, but the fixture was not located in an alcove and the fixture was not installed with accessible knee clearance. Classrooms on the upper floors were identified with barriers similar to those described on the first floor. Restrooms on the upper floors were single gender restrooms with the same or similar barriers as described above on the basement or first floors.

Exit stairways at the north side of corridors, or within classrooms located on the north side of the building, were identified with narrow doors, a 4" step in two locations and a fire hose bib that protrudes into the exit route with no detectable warning. Exit stairways in corridors are designated

as rescue areas, but the door thresholds at the stairway doors are 1/2" high with no bevel. No communication devices are provided within the rescue areas for people with disabilities to use to call for help or alert emergency personnel of their location. Door knobs were identified on the stairway side of the doors to the rescue areas.

The wheelchair lift on the third floor was labeled by the manufacturer as a porch lift. The lift was not initially identified with an operation key. After the inspection, one key was found in one of three control boxes. The lift needs a key to be inserted in each control at each location (north entry, lift, south entry) in order to operate. Students registered with Student Disability Services may be given a key to use, that they can carry with them, for each of the 3 control boxes, but visitors cannot use the lift at present. An incline platform lift may be a solution for this location that could both increase the stairway egress width to provide emergency egress for all people using the building while also providing vertical access at the stairway in the middle of the central corridor.

Areas assessed on floors 4 - 6 did not include restrooms or classrooms. Corridors and exit stairways on these levels were identified with barriers similar to those described above. The following barrier data records provide more detailed information on the barriers described above.

Field Date:	7/1/2011 Report Date 7/1/2011 Barrier #: 447
Bldg Name:	Pharmacy Building Reference Dwg: 1 of 6
